

Baja Designs Stealth/OnX Wiring

All Stealth/OnX Light bars have a microprocessor that performs thermal management of the LED's and allow a **dimming mode** and a **strobe mode**. If you want to use the dimming and strobe modes of the lightbar, a separate momentary contact switch is required. If you do not need this feature, then a single standard on/off switch is all that is required.

Connector Wiring (WeatherPak 3 Pin Connector)

When using a splitter on 20" Stealth/ 15" OnX Light bar or above, the vehicle must be running in order for the lights to activate.

When using the optional Momentary Switch, quickly depressing the switch will dim the light to 50% power. Depressing the switch again will toggle back to full power.

For Strobe mode, hold switch for two seconds.
